AWS CERTIFIED AI PRACTITIONER · AIF-C01

Domain2　生成式 AI 基礎　精選練習 10 題

第 1 題

A law firm wants to build an Al application by using large language models （LLMs） ◦ The application will read legal documents and extract key points from the documents. Which solution meets these requirements?

A. Build an automatic named entity recognition system.
B. Create a recommendation engine.
C. Develop a summarization chatbot.
D. Develop a multi-language translation system.

第 2 題

Which option is a use case for generative Al models?

A. Improving network security by using intrusion detection systems
B. Creating photorealistic images from text descriptions for digital marketing
C. Enhancing database performance by using optimized indexing
D. Analyzing financial data to forecast stock market trends

第 3 題

A company wants to create an application by using Amazon Bedrock. The company has a limited budget and prefers flexibility without long-term commitment. Which Amazon Bedrock pricing model meets these requirements?

A. On-Demand
B. Model customization
C. Provisioned Throughput
D. Spot Instance

第 4 題

Which term describes the numerical representations of real-world objects and concepts that AI and natural language processing （NLP） models use to improve understanding of textual information?

A. Embeddings
B. Tokens
C. Models
D. Binaries

第 5 題

What are tokens in the context of generative Al models?

A. Tokens are the basic units of input and output that a generative Al model operates on, representing words, subwords, or other linguisticunits.
B. Tokens are the mathematical representations of words or concepts used in generative Al models.
C. Tokens are the pre-trained weights of a generative Al model that are fine-tuned for specific tasks.d
D. Tokens are the specific prompts or instructions given to a generative Al model to generate output.

第 6 題

Which characteristic of generative Al models is an advantage in natural language processing (NLP) tasks?

A. Inherent transparency
B. Deterministic outputs
C. Novel and diverse outputs
D. Computational efficiency

第 7 題

Which type of neural network offers the ability to process text sequences with parallel computation?

A. Transformer neural network
B. Recurrent neural network (RNN)
C. Convolutional neural network (CNN)
D. Long short-term memory (LSTM) network

第 8 題

In which stage of the generative AI model lifecycle are tests performed to examine the model's accuracy?

A. Deployment
B. Data selection
C. Fine-tuning
D. Evaluation

第 9 題

Which strategy will prevent model hallucinations?

A. Fact-check the output of the large language model （LLM）。
B. Compare the output of the large language model （LLM） to the results of an internet search.
C. Use contextual grounding.
D. Use relevance grounding.

第 10 題

What is continued pre-training?

A. The process of fine-tuning a pre-trained language model on labeled data for a specific task
B. The process of providing unlabeled data to a pre-trained language model to improve the model's domain knowledge
C. The process of training a language model from the beginning on a specific dataset
D. The process of evaluating the performance of a pre-trained language model on a test set
